PROFESSIONAL SUMMARY

Problem-solver who translates business challenges into reliable, full-lifecycle solutions - shipping production features for enterprise customers across full-stack, event-driven, and event-sourcing architectures. Averaged a 2.16-day story cycle time against a 5-day target over 6 months, utilizing AI tooling while retaining ownership of the whole process, planning, design, and delivery. Adapts fast to new tools and stacks, sharpening how business needs get read and built into working products.

TECHNICAL SKILLS

Languages	C#, Python, Java, C++, SQL, TypeScript
Frameworks & Tools	.NET, Angular, Django, Git, Azure DevOps, AI Dev Tools (GitHub Copilot, Claude)
Engineering	OOP, Data Structures & Algorithms, REST APIs, Microservices, CI/CD, Event Driven Architecture, Debugging
Databases	SQL, MySQL, PostgreSQL
Practices	Agile Scrum, Code Reviews, System Design, SDLC, Requirements & Solution Design

PROFESSIONAL EXPERIENCE

Software Engineer II · LexisNexis South Africa

March 2026 - Present

- Delivered 3 major production features since March 2026, end-to-end from design through deployment and ongoing support, for enterprise systems used by labour and employment legal professionals across the United States.
- Contributed to the planning, design, and full-stack development (frontend, backend, database, Azure Pipelines) of an event-driven, AI-powered workflow platform that speeds up policy compliance analysis for labour and employment lawyers.
- Built and shipped a CQRS-based service with structured error handling and 92% unit test coverage, now the shared service reused by every product that needs it (currently 2 product surfaces), removing the need for each team to build its own.
- Resolved 3 production incidents and various migration defects (in Lexis Protege), preventing downtime and keeping a feature stable.
- Reviewed requirements against delivered work and caught gaps before release, preventing customer-facing defects.
- Leveraged AI-assisted development tools (GitHub Copilot, Claude) including Github actions (for CI/CD) in line with the company's GenAI productivity initiative, cutting my average story cycle from 5+ days to 2–3 days.

Graduate Software Engineer · LexisNexis South Africa

2025 – Feb 2026

- Contributed to revamping the Lexis+ UK News feature, redesigning how news is presented so legal professionals see content more relevant to them in a clearer, more informative format.
- Worked on the document export experience for Lexis+ UK, ensuring reports, news, and legal documents download in a structure suited to each professional's purpose, from research to formal submission.
- Began the design and development of 2 major features, which I went on to deliver after promotion to Software Engineer II.
- Performed root cause analysis on recurring defects, fixing underlying causes rather than symptoms so the same issues stopped reappearing.
- Ramped up on C#, .NET, Angular, and both microservice and monolithic codebases, earning promotion to Software Engineer II within 14 months.

Residence Tutor · University of Cape Town

2022

- Mentored students on CS coursework, algorithm design, and data structures — building strong communication and leadership skills.

PROJECTS

AutoTask SQL Generator | *University of Cape Town — Capstone Project*

- ▶ Built a system that auto-generates SQL assignment questions for lecturers, eliminating manual effort and improving assessment consistency.
- ▶ Implemented algorithmic question-generation logic demonstrating practical algorithm development, OOP design, and independent problem ownership.

Feedback-Insights | *Personal Project – in POC state*

- ▶ Multi-tenant feedback-analytics platform (FastAPI, React, SQLAlchemy) with an embeddable widget, JWT-scoped admin auth, and per-tenant API-key ingestion, letting any product capture and triage user feedback at scale.
- ▶ Designed a cost-efficient hybrid NLP pipeline (local sentence-embeddings + KMeans clustering + a single Claude API call per report) that auto-generates ranked, human-readable themes for issues, compliments, and suggestions — keeping counts deterministic while cutting LLM usage to one call per report

VaultID | *Personal Project – In POC state*

- ▶ Designed and built an event-sourced personal data vault platform (C#/.NET 10, Angular 19, Supabase) enabling users to selectively share categorized personal data with organisations under time-boxed, revocable consent grants, with a fully auditable activity feed for every access.
- ▶ Architected a strict 4-layer system (data-access, domain, application, API) enforcing all business rules server-side, implemented JWT-secured multi-tenant authorization, and shipped a category-based permission engine with granular field-level access control and verification-without-disclosure.

EDUCATION

BSc Computer Science & Computer Engineering

University of Cape Town · 2020 - 2025

ACHIEVEMENTS & AWARDS

★ Distinction — Computer Science (CSC1016S) ★ Energy innovation Challenge Participant ★ Mathematics Olympiad Participant ★ UCT Plus Hours Bronze Award ★ Top HDI Learner, Alfred Nzo West District (2nd Place)
